Egyptian Medical Journal

1990 v7 n5

An attempt to assess satisfaction & current sexual function for those who underwent surgery of hydroflex penile prosthesis implantation was made 88.2% excellent satisfaction rate was noted in these patients, with other 11.8% expressing some degree off satisfaction. They also denoted improvement of sexual desire & ejaculation in 29.4%, better erection power mostly with moderate extent (76.4%), & regained orgasm in 41.2%. Both satisfaction & improvement were positively reflected on sexual performance & willingness to recommend the implantation surgery to others (58.8%). Discussion of the results was followed by suggestions for securing the best responses in recipients of such specialized operation from the psychological standpoint
