Thesis ; M.Sc. 1995

To study this phenomena, know its extent in society. compare between circumcised, uncircumcised females regarding psychological and sexual effects. case control study.

Tools used were:(Questionnaire about attitude of females towards circumcision- Eysenck Personality Inventory-Sexual Inventory modified, extracted from Derogates Sexual Inventory).

The chief motive was religious then inherited customs.

Women reported physical and hygienic complications after operation .

Most women were illiterate, operated upon by midwives or doctors.

Most of circumcised females had high neurotic score and reached orgasm with difficulty.

The most important side effects of circumcision were sexual dis-satisfaction and anorgasmia.
